

An NFA can have zero, one or more than one move from a given state on a given input symbol. An NFA can also have NULL moves (moves without input symbol). On the other hand, DFA has one and only one move from a given state on a given input symbol.

### Conversion from NFA to DFA

Suppose there is an NFA  $N = \langle Q, \Sigma, q_0, \delta, F \rangle$  which recognizes a language  $L$ . Then the DFA  $D = \langle Q', \Sigma, q_0, \delta', F' \rangle$  can be constructed for language  $L$  as:

Step 1: Initially  $Q' = \emptyset$ .

Step 2: Add  $q_0$  to  $Q'$ .

Step 3: For each state in  $Q'$ , find the possible set of states for each input symbol using transition function of NFA. If this set of states is not in  $Q'$ , add it to  $Q'$ .

Step 4: Final state of DFA will be all states which contain  $F$  (final states of NFA)

### Example

Consider the following NFA shown in Figure 1.

Figure 1

Following are the various parameters for NFA.

$Q = \{ q_0, q_1, q_2 \}$

$\Sigma = \{ a, b \}$

$F = \{ q_2 \}$

$\delta$  (Transition Function of NFA)

State	a	b
q0	q0,q1	q0
q1		q2
q2		

Step 1:  $Q' = \emptyset$

Step 2:  $Q' = \{ q_0 \}$

Step 3: For each state in  $Q'$ , find the states for each input symbol.

Currently, state in  $Q'$  is  $q_0$ , find moves from  $q_0$  on input symbol  $a$  and  $b$  using transition function of NFA and update the transition table of DFA.

$\delta'$  (Transition Function of DFA)

State	a	b
$q_0$	$\{q_0, q_1\}$	$q_0$

Now  $\{q_0, q_1\}$  will be considered as a single state. As its entry is not in  $Q'$ , add it to  $Q'$ .  
So  $Q' = \{q_0, \{q_0, q_1\}\}$

Now, moves from state  $\{q_0, q_1\}$  on different input symbols are not present in transition table of DFA, we will calculate it like:

$$\delta'(\{q_0, q_1\}, a) = \delta(q_0, a) \cup \delta(q_1, a) = \{q_0, q_1\}$$

$$\delta'(\{q_0, q_1\}, b) = \delta(q_0, b) \cup \delta(q_1, b) = \{q_0, q_2\}$$

Now we will update the transition table of DFA.

$\delta'$  (Transition Function of DFA)

State	a	B
$q_0$	$\{q_0, q_1\}$	$q_0$
$\{q_0, q_1\}$	$\{q_0, q_1\}$	$\{q_0, q_2\}$

Now  $\{q_0, q_2\}$  will be considered as a single state. As its entry is not in  $Q'$ , add it to  $Q'$ .  
So  $Q' = \{q_0, \{q_0, q_1\}, \{q_0, q_2\}\}$

Now, moves from state  $\{q_0, q_2\}$  on different input symbols are not present in transition table of DFA, we will calculate it like:

$$\delta'(\{q_0, q_2\}, a) = \delta(q_0, a) \cup \delta(q_2, a) = \{q_0, q_1\}$$

$$\delta'(\{q_0, q_2\}, b) = \delta(q_0, b) \cup \delta(q_2, b) = \{q_0\}$$

Now we will update the transition table of DFA.

$\delta'$  (Transition Function of DFA)

State	a	B
q0	{q0,q1}	q0
{q0,q1}	{q0,q1}	{q0,q2}
{q0,q2}	{q0,q1}	q0

As there is no new state generated, we are done with the conversion. Final state of DFA will be state which has q2 as its component i.e., { q0, q2 }

Following are the various parameters for DFA.

$Q' = \{ q0, \{ q0, q1 \}, \{ q0, q2 \} \}$

$\Sigma = (a, b)$

$F = \{ \{ q0, q2 \} \}$  and transition function  $\delta'$  as shown above. The final DFA for above NFA has been shown in Figure 2.

Figure 2

**Note :** Sometimes, it is not easy to convert regular expression to DFA. First you can convert regular expression to NFA and then NFA to DFA.

**Question :** The number of states in the minimal deterministic finite automaton corresponding to the regular expression  $(0 + 1)^* (10)$  is \_\_\_\_\_.

**Solution :** First, we will make an NFA for the above expression. To make an NFA for  $(0 + 1)^*$ , NFA will be in same state q0 on input symbol 0 or 1. Then for concatenation, we will add two moves (q0 to q1 for 1 and q1 to q2 for 0) as shown in Figure 3.

Using above algorithm, we can convert NFA to DFA as shown in Figure 4

State	0	1
q0	q0	q0,q1
q0,q1	q0,q2	q0,q1
q0,q2	q0	q0,q1

Figure 4

DFA minimization stands for converting a given DFA to its equivalent DFA with minimum number of states. DFA minimization is also called as Optimization of DFA and uses partitioning algorithm.

### **Minimization of DFA**

Suppose there is a DFA  $D = \langle Q, \Sigma, q_0, \delta, F \rangle$  which recognizes a language  $L$ . Then the minimized DFA  $D = \langle Q', \Sigma, q_0, \delta', F' \rangle$  can be constructed for language  $L$  as:

**Step 1:** We will divide  $Q$  (set of states) into two sets. One set will contain all final states and other set will contain non-final states. This partition is called  $P_0$ .

**Step 2:** Initialize  $k = 1$

**Step 3:** Find  $P_k$  by partitioning the different sets of  $P_{k-1}$ . In each set of  $P_{k-1}$ , we will take all possible pair of states. If two states of a set are distinguishable, we will split the sets into different sets in  $P_k$ .

**Step 4:** Stop when  $P_k = P_{k-1}$  (No change in partition)

**Step 5:** All states of one set are merged into one. No. of states in minimized DFA will be equal to no. of sets in  $P_k$ .

### **How to find whether two states in partition $P_k$ are distinguishable ?**

Two states  $(q_i, q_j)$  are distinguishable in partition  $P_k$  if for any input symbol  $a$ ,  $\delta(q_i, a)$  and  $\delta(q_j, a)$  are in different sets in partition  $P_{k-1}$ .

### **Example**

Consider the following DFA shown in figure.

**Step 1.** P0 will have two sets of states. One set will contain q1, q2, q4 which are final states of DFA and another set will contain remaining states. So  $P_0 = \{ \{ q_1, q_2, q_4 \}, \{ q_0, q_3, q_5 \} \}$ .

**Step 2.** To calculate P1, we will check whether sets of partition P0 can be partitioned or not:

**i) For set { q1, q2, q4 } :**

$\delta(q_1, 0) = \delta(q_2, 0) = q_2$  and  $\delta(q_1, 1) = \delta(q_2, 1) = q_5$ , So q1 and q2 are not distinguishable.

Similarly,  $\delta(q_1, 0) = \delta(q_4, 0) = q_2$  and  $\delta(q_1, 1) = \delta(q_4, 1) = q_5$ , So q1 and q4 are not distinguishable.

Since, q1 and q2 are not distinguishable and q1 and q4 are also not distinguishable, So q2 and q4 are not distinguishable. So, { q1, q2, q4 } set will not be partitioned in P1.

**ii) For set { q0, q3, q5 } :**

$\delta(q_0, 0) = q_3$  and  $\delta(q_3, 0) = q_0$

$\delta(q_0, 1) = q_1$  and  $\delta(q_3, 1) = q_4$

Moves of q0 and q3 on input symbol 0 are q3 and q0 respectively which are in same set in partition P0. Similarly, Moves of q0 and q3 on input symbol 1 are q1 and q4 which are in same set in partition P0. So, q0 and q3 are not distinguishable.

$\delta(q_0, 0) = q_3$  and  $\delta(q_5, 0) = q_5$  and  $\delta(q_0, 1) = q_1$  and  $\delta(q_5, 1) = q_5$   
 Moves of  $q_0$  and  $q_5$  on input symbol 1 are  $q_1$  and  $q_5$  respectively which are in different set in partition  $P_0$ . So,  $q_0$  and  $q_5$  are distinguishable. So, set  $\{q_0, q_3, q_5\}$  will be partitioned into  $\{q_0, q_3\}$  and  $\{q_5\}$ . So,  
 $P_1 = \{\{q_1, q_2, q_4\}, \{q_0, q_3\}, \{q_5\}\}$

To calculate  $P_2$ , we will check whether sets of partition  $P_1$  can be partitioned or not:

**iii) For set  $\{q_1, q_2, q_4\}$  :**

$\delta(q_1, 0) = \delta(q_2, 0) = q_2$  and  $\delta(q_1, 1) = \delta(q_2, 1) = q_5$ , So  $q_1$  and  $q_2$  are not distinguishable.

Similarly,  $\delta(q_1, 0) = \delta(q_4, 0) = q_2$  and  $\delta(q_1, 1) = \delta(q_4, 1) = q_5$ , So  $q_1$  and  $q_4$  are not distinguishable.

Since,  $q_1$  and  $q_2$  are not distinguishable and  $q_1$  and  $q_4$  are also not distinguishable, So  $q_2$  and  $q_4$  are not distinguishable. So,  $\{q_1, q_2, q_4\}$  set will not be partitioned in  $P_2$ .

**iv) For set  $\{q_0, q_3\}$  :**

$\delta(q_0, 0) = q_3$  and  $\delta(q_3, 0) = q_0$

$\delta(q_0, 1) = q_1$  and  $\delta(q_3, 1) = q_4$

Moves of  $q_0$  and  $q_3$  on input symbol 0 are  $q_3$  and  $q_0$  respectively which are in same set in partition  $P_1$ . Similarly, Moves of  $q_0$  and  $q_3$  on input symbol 1 are  $q_1$  and  $q_4$  which are in same set in partition  $P_1$ . So,  $q_0$  and  $q_3$  are not distinguishable.

**v) For set  $\{q_5\}$  :**

Since we have only one state in this set, it can't be further partitioned. So,

$P_2 = \{\{q_1, q_2, q_4\}, \{q_0, q_3\}, \{q_5\}\}$

Since,  $P_1 = P_2$ . So, this is the final partition. Partition  $P_2$  means that  $q_1, q_2$  and  $q_4$  states are merged into one. Similarly,  $q_0$  and  $q_3$  are merged into one.

Minimized DFA corresponding to DFA of Figure 1 is shown in Figure 2 as:

**Question :** Consider the given DFA. Which of the following is false?

1. Complement of  $L(A)$  is context-free.
2.  $L(A) = L((11^*0 + 0)(0 + 1)^*0^*1^*)$
3. For the language accepted by A, A is the minimal DFA.
4. A accepts all strings over  $\{0, 1\}$  of length atleast two.

- A. 1 and 3 only
- B. 2 and 4 only
- C. 2 and 3 only
- D. 3 and 4 only

**Solution :** Statement 4 says, it will accept all strings of length atleast 2. But it accepts 0 which is of length 1. So, 4 is false.

Statement 3 says that the DFA is minimal. We will check using the algorithm discussed above.

$P_0 = \{ \{ q_2 \}, \{ q_0, q_1 \} \}$

$P_1 = \{ q_2 \}, \{ q_0, q_1 \} \}$ . Since,  $P_0 = P_1$ ,  $P_1$  is the final DFA.  $q_0$  and  $q_1$  can be merged. So minimal DFA will have two states. Therefore, statement 3 is also false.

So correct option is (D).
